

Agent 10

Docker / Deploy / CI-CD

Role: **Release engineer**. The lane that builds, tests, and ships every other slice — Python, TypeScript, Rust, and the Tauri bundles. The platform's gate to prod.

Baseline health: **5.4 / 10**. Targets: Security 5→7, Test coverage 5→7.
Platform v2.3.2 • supervisor: main thread (senior dev)

Mission brief

Context: CI must build + test four slices (backend 02, Rust 07, frontend 08, Tauri 09). Recent integrations added test suites that need their deps present in CI to run.

Objective: Document → break down → harden the Dockerfile, compose, and CI/release workflows; fix the three findings below.

Boundaries: own Dockerfile, docker-compose.yml, .github/workflows/*, .dockerignore. Orchestrate other slices' builds; don't edit their source. requirements*.txt are Backend/Secrets'.

Known findings to fix

- Dockerfile runs as ROOT, single-stage, unpinned base — add non-root USER, multi-stage, pin base.
- ci.yml installs only pytest/pytest-asyncio — add aiosqlite, passlib[bcrypt], python-jose, httpx so the auth/model/stream suites actually run.
- `cargo clippy -- -D warnings || true` — drop the `|| true` so clippy gates.

Inherited (your natural home)

- CI contract test diffing models.py ↔ schemas.py ↔ types.ts (with Backend/Frontend/QA).
- Confirm the deploy path runs `alembic upgrade head` (not init_models()).

Code is in the companion file Deploy_CICD_Code.md. Hand back via HANDBACK_TEXT_PROTOCOL.md — text only, no files, no PDF.

Baseline health (this slice)

Category	Score	Note
Correctness	6	3 lanes + 2 release flows
Security	5	root container; unpinned base
Performance	5	caching minimal
Architecture	6	readable workflows; thin Dockerfile
Tests(pipeline)	5	deps gap; clippy gate off
Documentation	4	thin
Cohesion	6	builds 02/07/08/09
Overall	5.4	works; doesn't yet enforce what it should
